NUFARM CARINATA

Grower Journey:

Preliminary Presentation | Results from Phases 01 to 03

ZMP Consultoria · August 2026

CONTEXTUALIZATION

About the Project

The Carinata Grower Experience Optimization project in Brazil seeks to deeply understand the current producer journey, consolidate ecosystem learnings, and transform them into practical guidelines for the evolution of the experience and acceleration of crop adoption.

WE ARE HERE

01
Data Consolidation and Interview Preparation
Analysis of internal materials, immersion with the Nufarm team, and analytical structuring of the project

02
Qualitative Interviews and Ecosystem Investigation
Producers, consultants, channels, and Nufarm team

03
Current Journey Mapping (As-Is)
Mapping of stages, friction points, and experience gaps

04
Future Experience Design (To-Be)
Value Moments, personas, and drivers

05
Strategic Roadmap
Prioritization, quick wins, and governance

INTERVIEWS

Who We Have Heard From So Far

Qualitative interviews conducted with different stakeholder profiles in the Carinata chain in the states of SP, PR, SC, and RS, covering both adopters and non-adopters.

5

Nufarm Team

Commercial Manager, Marketing Manager, Technical Coordinator, RTVs

19

Growers

Adopters and non-adopters (SP, PR, SC, and RS)

4

Consultants / Influencers

Regional technical consultancies

5

Channels (cooperatives/dealers)

Produza, Coopercampos, Cooperalfa , C.Vale e Agraria

33 interviews conducted · 4 regions (SP, PR, SC, and RS)

ZMP Methodology

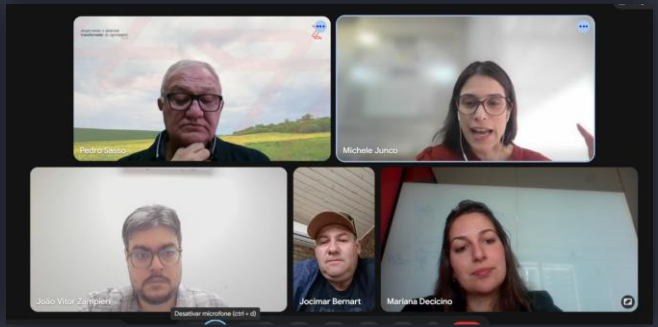
- **In-depth interviews:** individual conversations of 45 to 60 minutes, organized around a semi-structured script,

- **~85% of interviews transcribed:** all interviews are fully transcribed, ensuring no relevant detail is lost and allowing structured, traceable analysis of accounts.

- **Multidisciplinary and collaborative analysis:** interviews feature the simultaneous participation of 2 to 4 ZMP consultants, including a partner-consultant, expanding the capacity to capture nuances and different perspectives

- **Active listening and deepening:** consultants explore responses, contradictions, and points of attention identified throughout the interview, seeking to go beyond spontaneous answers.

- **Insight consolidation:** after interviews, content is analyzed in a structured way to identify patterns, divergences and root causes.



PHASE 02 METHODOLOGY

1

Voice of Customer (VoC)

Consolidation of perceptions and adoption drivers

- Qualitative interviews with priority stakeholders (adopting and non-adopting growers, consultants, Nufarm team)
- Consolidation of main patterns, barriers, and opportunities identified

2

Behavioral Analysis

Factors that influence trust and decision-making

- Identification of the main trust drivers and risk perception
- Analysis of factors that impact adoption, continuity, and retention

3

Stakeholder Mapping

Carinata ecosystem dynamics

- Mapping of main influencers and decision-makers
- Identification of dynamics that accelerate or hinder adoption and trust

Factors that Influence Decisions and Behavioral Changes

1 EXPERIMENT

What leads to testing?

1. Financial return proposition
2. Cooperative or consultant incentive
3. Curiosity about the new winter crop

2 TRUST

What generates trust?

1. Purchase guarantee (closed-system contract)
2. Qualified technical assistance
3. Results in neighboring farms
4. Nufarm credibility

3 RISK

Which risks and barriers weigh most?

1. Perception of hybrid susceptibility to white mold in humid and high-altitude regions
2. Technical learning curve
3. Lack of local references
4. Concern about the price paid on surplus value

4 RECURRENCE

What leads to planting again?

1. Financial return
2. Fit in the agricultural calendar
3. Rustic crop, requiring little or no management
4. Proximity of the technical team, conveying security and credibility

5 RECOMMENDATION

What leads to recommending to others?

1. Positive experience (financial result)
2. Cooperative support
3. Agronomic benefits (perceived, mainly, after 2 or 3 harvests)
4. Confidence in the business model

What Blocks and What Accelerates Adoption

Frequency with which each topic appeared as a barrier or trust driver in the interviews conducted.

Illustrative scale (0–9) based on the recurrence of the topic in the interviews analyzed.

Where the Chain Tightens: Critical Points by Stage

STAGE	RISK	CRITICAL POINT	WHAT HAPPENS
Planting	High	**Seeding rate and ideal timing**	Small seeds make it difficult to assess failures; seed delivery delays push planting outside the ideal window and interfere with soybean planting during the growing season
Development	High	**White mold (Sclerotinia), long cycle, and lack of registered herbicide**	Perception of high susceptibility to white mold paralyzes decisions in regions above 600m and in rainy winter areas. The 170–180-day cycle may collide with the soybean window. Lack of broadleaf herbicide (turnip, fleabane) is a growing barrier compared to canola.
Harvest	Medium	**Machinery calibration and plant size**	Plant height ranges from 1.5m to 1.9m in the South, reaching 3m in the Cerrado (GO, MS). Uncalibrated machinery can cause losses of up to 10 bags/ha.
Receiving	High	**Distant receiving points and classification criteria**	Producers travel long distances to deliver their production — currently the main limiting factor compared to canola. Additionally, the assessment criterion (incorrect sieves during Carinata receiving) was highlighted as something that often harms the producer.
Commercial	Medium	**Single buyer dependence and surplus price**	Closed contract provides security for conservative profiles. For more autonomous profiles, the absence of competition in purchasing limits negotiating power — especially on the surplus price (production above the contracted volume).
After-Sales	High	**Problem resolution/quality**	Lean field team, dependent on local partners. In PR, RTV monitoring generated high repurchase rates. In MS, the absence of structured support after classification problems resulted in complete abandonment of the crop.

Decision Drivers Matrix

Decision Driver	Impact (1-5)	Frequency (1-5)	Priority
Profitability / Financial Return	5	5	★★★★★
Commercialization security	5	5	★★★★★
Low production cost	4	4	★★★★☆
Technical Assistance and Support	4	4	★★★★☆
Agronomic Performance / Productivity	4	4	★★★★☆
Fit in the agricultural calendar	4	3	★★★☆☆
Channel trust	4	3	★★★☆☆
Sustainability	2	1	★☆☆☆☆

Frequency

5 = ≥ 80% das entrevistas (≥ 27/33)

4 = 60–79% (20–26/33)

3 = 40–59% (13–19/33)

2 = 20–39% (7–12/33)

1 = < 20% (1–6/33)

Actor Influence on Carinata Adoption

LEGEND

High influence
Moderate influence

VOICE OF CUSTOMER (VoC)

What the Ecosystem is Saying

Top Insights

NEEDS

Profitability, commercial security, and close technical support

EXPECTATIONS

Transparent contract, price above canola, and continuous field support

FRUSTRATIONS

Lack of prior information, delivery logistics, and surplus price below contract

PERCEPTIONS

Promising crop, with a learning curve and a closed system that limits negotiation

OPPORTUNITIES

Strengthen technical presence, expand receiving points, and create local references

Main Themes by Audience

TOPIC	Growers	CHANNELS	CONSULTANTS
Commercializatio n	Insecurity with single buyer and surplus price	Lack of minimum volume to structure receiving and operate the crop at scale	Profitability is the only real trigger — when the price equals canola's, the argument weakens
Technical Support	Need for more field presence during the cycle	Commercial team still lacking information and training	Engaged consultants become promoters; those who don't know the crop block or ignore it
Certification	Simple where documentation is regular; obstacle in areas with environmental liabilities	Complexity in engaging producers with environmental irregularities	For those who are informed, it is not a barrier; for others, it reduces the appetite to recommend
Input Supply	Seed delivery delays compromise the planting window	Portfolio still limited to a single genotype	Single hybrid and long cycle restrict the recommendation of the crop for different production contexts

Representative Quotes

PRODUCER

"I want to plant more, but I need to be sure I'll be able to sell safely and at a fair price."

CHANNELS

"Carinata has potential, but we need more scale and predictability to organize the receiving chain."

CONSULTANT

"The producer is very hungry for novelty, but agronomists need to embrace these innovations more."

GrowerPersonas and Behavioral Archetypes

Executive

- Makes decisions rationally and results-oriented
- Prioritizes profitability, productivity, and predictability
- Lower willingness to take risks
- Seeks objective information and concrete data
- Values scale, operational efficiency, and security

Cooperativist

- Guided by trust in the cooperative
- Reproduces only what is recommended by the cooperative
- More receptive when collective validation exists
- Values close assistance and support
- Sees the cooperative as a risk reducer and legitimizer of new technologies

Pioneer

- Curious, innovative, and willing to experiment with new crops (even without proof)
- Continuously seeks opportunities
- Greater tolerance for risk and uncertainty
- Learns by doing and values the exchange of experiences
- Potential to become a reference and influencer in the chain

Skeptic

- Has already shown openness to innovation but had a frustrating experience
- The failure increased their risk aversion
- Does not necessarily reject the crop, but has a high degree of dissatisfaction and distrust
- Needs to be convinced of what has changed before carrying out a new test
- Values close monitoring and risk reduction

Actor Influence on Carinata Adoption

Executive

Stakeholder	Role in the Journey	Influence	Grower Trust	Impact on Decision
Channels	Connect the producer to the crop: provide inputs, credit, and access to information. Have the power to endorse or block adoption	Medium	Medium	High
Consultants	Guide management and validate the technical decision. High proximity to the producer — recommend or divert positioning to known crops	High	High	High
Reference Growers	Generate social proof. Have high influence on neighboring producers	Medium	High	Medium
Trading/Buyers	Influence the producer's delivery and receiving experience. A bad experience can block a future repurchase	Very High	Medium	Very High
Nufarm	Develops genetics, provides technical support, and manages certification. Responsible for fostering the crop and training the system	High	Medium	High
Research Institutions	Generate and validate independent technical knowledge. Their credibility reduces uncertainty for producers and consultants	High	High	High

PHASE 3 – DELIVERABLES

CURRENT JOURNEY
CURRENT JOURNEY (AS-IS)

CURRENT JOURNEY (AS-IS)

Optimized Journey Stages

JOURNEY STAGES	DISCOVERY	CONSIDERATION AND DECISION	CERTIFICATION	PLANTING	DEVELOPMENT	HARVEST	COMMERCIALIZATION	NEXT CYCLE
PRODUCER ACTIONS	• Hears about Carinata through cooperative, colleague, RTV, or consultant • Seeks initial information about management and ROI • Talks with producers who have already planted	• Researches management, costs, and benefits vs. other crops (e.g., Wheat and Canola) • Simulates ROI per hectare • Consults technicians, cooperatives, and other producers • Visits fields when available	• Submits/fills in required documentation • Registers planting area according to protocol • The process is coordinated by Nufarm • Awaits approval for release of certified seed	• Prepares area and calibrates the planter • Plants according to consultant's positioning • Applies fertilization and pesticides recommended by channel/consultant • Seeks technical support, mainly in the 1st harvest	• Monitors crop development week by week • Performs phytosanitary control (if necessary)	• Desiccation • Calibrates the harvester before harvesting • Evaluates productivity	• Carries out grain transport • Formalizes delivery according to contract • Awaits payment and evaluates the value effectively received	• Evaluates financial results and compares with other crops (mainly Canola) • Observes impact on the successor soybean crop • Decides area and conditions for the next harvest
NEEDS	• Reliable information about the crop • Real cases in regions with similar characteristics • Local productivity references	• Reliable technical data by environment and region • Clear economic simulation comparing alternatives • Security regarding agronomic risks	• Simple and well-guided certification process • Consultant support for documentation • Return within the appropriate (short) timeframe so as not to compromise the planting window	• Seed available at the right time • Intensive technical assistance • Clear instructions on planter calibration	• Close and agile technical monitoring • Economic solutions for pests and diseases (if applicable) • Weed management alternative (mainly broadleaves)	• Adequate harvester in the correct calibration • Technical support regarding the ideal desiccation point • Safe and accessible storage	• Fair price consistent with the contract (even on production surpluses) • Nearby and accessible delivery point (lower cost) • Agility and transparency in payment	• Clear and measurable results to support replanting decision • Structured planning for the next harvest • Continued trust in the commercial partner
EXPECTATIONS	• New crop more profitable than others • Viable alternative for the off-season period • Crop fit in the current system without major changes	• Technical and economic viability • Fit in the calendar without delaying soybeans and other summer crops • Low production cost with little or no management (rusticity)	• Fast, simple, and well-guided process • Documentation completed and area approved without delaying the planting window	• Efficient establishment and uniform emergence • Row closure in a few days • Frost tolerance	• Healthy and vigorous development • Little or no management • Expected productivity confirmed throughout the cycle • Frost tolerance	• Harvest within the promised timeframe (leaner cycle) • Minimum productivity of 20 bags/ha	• Competitive price consistent with the contracted amount • Low-cost delivery (freight) • Fast payment	• Positive ROI that justifies area expansion • System evolution with incorporated learning
EMOTIONS	Curiosity and Hope	Analysis and Caution	Commitment	Apprehension and Uncertainty	Apprehension and Uncertainty	Apprehension and Uncertainty	Determination and Expectation	Satisfaction
PAIN POINTS AND FRICTION	• Lack of information • Lack of local references • Lack of knowledge of the real risks of the crop	• High perceived risk due to greater susceptibility to white mold • Limited portfolio: single hybrid • Single buyer dependence • When the price is equivalent to Canola, canola planting takes precedence over Carinata	Process perceived as bureaucratic only in areas with environmental irregularities or lack of documentation	Planter calibration for small seeds combined with lack of prior instruction • Slow germination generates anxiety and concern about row closure	White mold as the main problem High cost in managing white mold (when necessary) Lack of registered herbicide	Long cycle with risk of extension depending on weather conditions Losses due to lodging and inadequate machine calibration Desiccation point for uniformity during harvest	Distant delivery point increases freight cost • Concern about the value to be received on the surplus • Concern about not fulfilling the contract (low productivity)	• Concerns about the multiplication of sclerotia (white mold) in the soil and damage to soybeans
STAKEHOLDERS INVOLVED	• Channels • Neighboring producers • Technical consultants	• Channels • Technical consultants • Research institutions • Trading/buyers	• Channels • Nufarm • Trading/buyers	• Channels • Nufarm • Technical consultants	• Channels • Nufarm • Technical consultants	• Channels • Nufarm • Technical consultants	• Trading/buyers • Nufarm	• Technical consultants • Nufarm
OPPORTUNITIES	• Communicate Carinata's value with real cases and local references before the producer reaches the channel uninformed	• Conducting tests and producing materials that reduce perceived risk	• Ensure the appropriate timing for documentation feedback and area approval, so as not to delay the planting timing	• Ensure intensive technical support in the first harvest, from planting to harvest, minimizing risks and undue perceptions	• Qualified technical assistance throughout the cycle	• Prior information about possible problems during harvest and assistance whenever necessary	• Expansion of receiving points	• Monitor the evolution of soybeans in areas where Carinata was planted and remain present for the producer

Next Steps

1. Interviews with producers listed by ZMP
2. Personas: detailing
3. Pain Prioritization Matrix
4. Catch-up meeting with the local team
5. Future Journey Design (To-Be)
6. Strategic Roadmap Delivery

THANK YOU.
